

Drive productivity and sustainability with a safe and smart cleaning and hygiene process

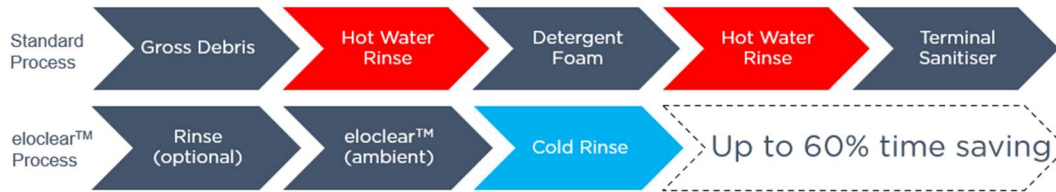

Looking for a powerful and sustainable solution to simplify your hygiene process without compromising food safety?

Look no further than eloclear™ from Ozo Innovations!

Our innovative technology allows you to produce eloclear™ in-situ at your facility, providing you with a green, clean and sustainable chemical that also improves your factory's effluent discharge profile.

By deploying eloclear™, you can significantly improve your margin by cleaning faster, utilising labour more efficiently, reducing water and energy consumption, and reducing the number and volume of chemicals used in the hygiene process.

The actual hygiene process varies by customer food process & site

As a pre-commercial cleantech business, we use novel electrochemical solutions to disrupt hard surface cleaning and disinfection processes. Our electrochemical generators, elocube™ and elosystem™, are fully automated and proven through customer trials.

Technology platform is fully automated, robust & scalable.

eloclear™ efficacy has been verified and validated by independent, third-party UKAS accredited laboratories, has M&S terminal sanitiser approval and has been validated in customer trials.

By partnering with us, you can help reduce your carbon footprint and improve your environmental impact, all while simplifying your hygiene process and improving your bottom line. Let's work together to save the planet and make a positive impact on the food industry! Contact us today to learn more.
